

## RF Signal Processor for CD Players

### Description

The CXA2581N is an RF signal processing IC for compact disc players.

### Features

- Wide band RF signal processing
- RF system VCA circuit
- RF system equalizer (supports CAV mode)
- Supports pickups with built-in RF summing amplifier
- Low current consumption mode (EQ Pass mode)
- RW/ROM switching mode
- Center error amplifier
- Output DC level shift circuit
- TE balance adjustment function

### Absolute Maximum Ratings

|                               |                  |             |    |
|-------------------------------|------------------|-------------|----|
| • Supply voltage              | V <sub>CC</sub>  | 7           | V  |
| • Storage temperature         | T <sub>STG</sub> | -65 to +150 | °C |
| • Allowable power dissipation | P <sub>D</sub>   | 620         | mW |

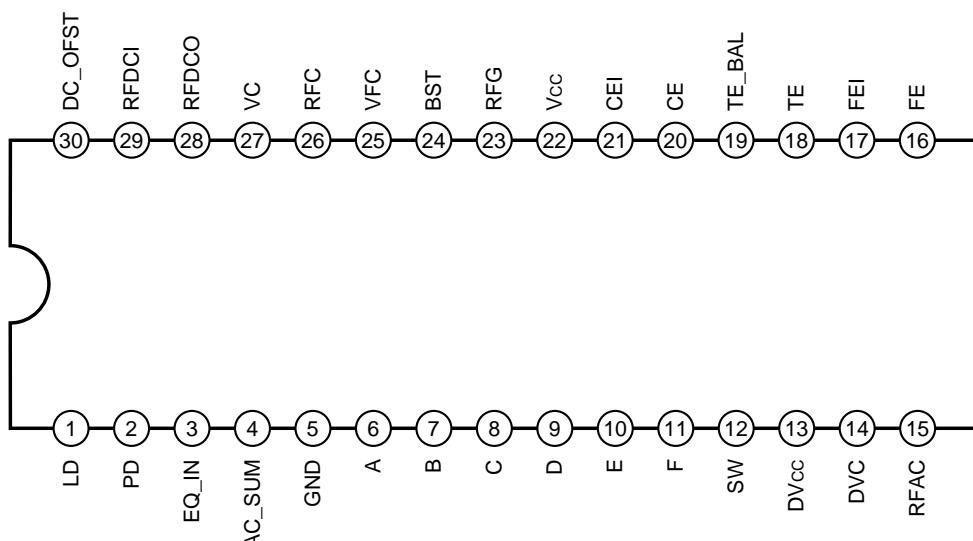

### Functions

- RF AC summing amplifier, equalizer, VCA
- RF DC summing amplifier
- Focus error amplifier
- Tracking error amplifier
- Center error amplifier
- Automatic power control
- VC buffer amplifier (analog block, digital block)

### Operating Conditions

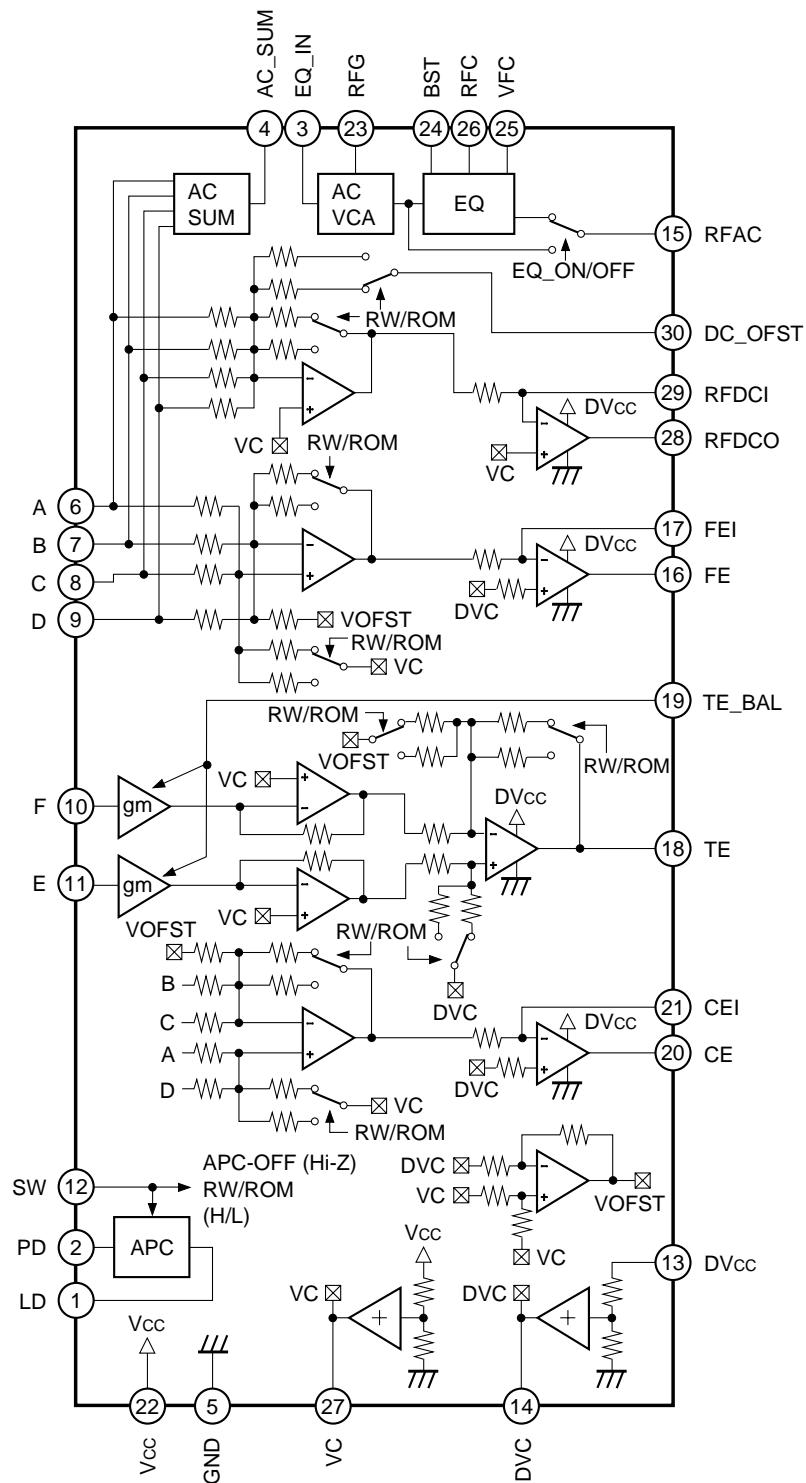

- Operating supply voltage range  
V<sub>CC</sub> – GND    3.4 to 5.5    V  
(0V ≤ V<sub>CC</sub> – DV<sub>CC</sub> < 2V)
- Note) Care should be taken for the operating voltage.  
See page 18.
- Operating temperature    T<sub>OPR</sub>    -30 to +85    °C

### Pin Configuration

Sony reserves the right to change products and specifications without prior notice. This information does not convey any license by any implication or otherwise under any patents or other right. Application circuits shown, if any, are typical examples illustrating the operation of the devices. Sony cannot assume responsibility for any problems arising out of the use of these circuits.

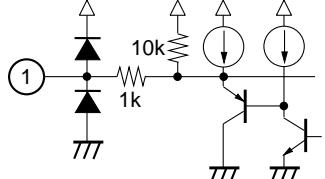

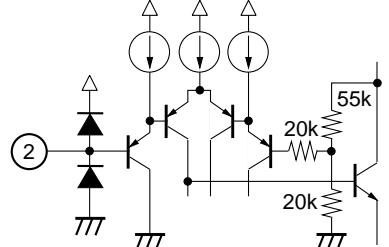

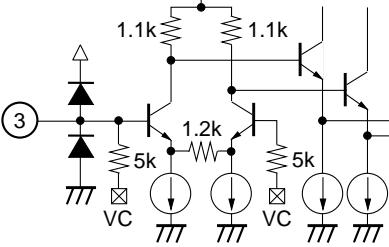

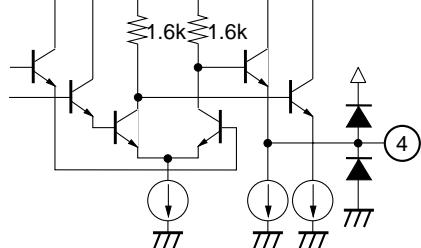

## Block Diagram

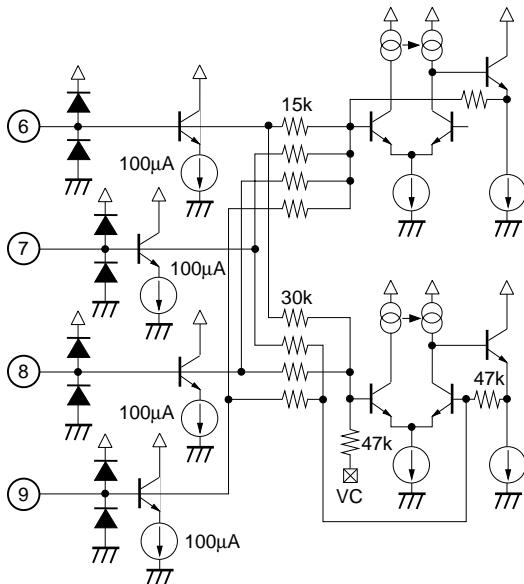

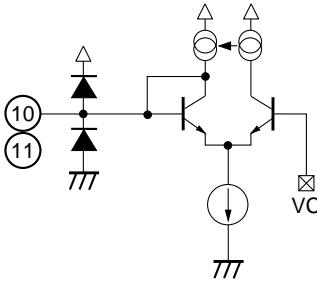

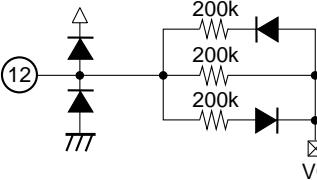

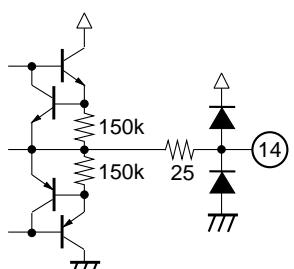

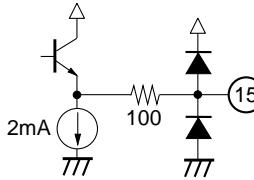

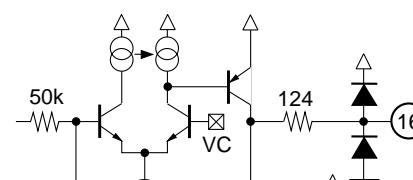

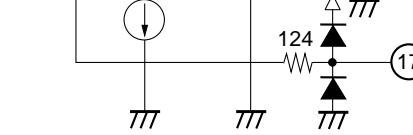

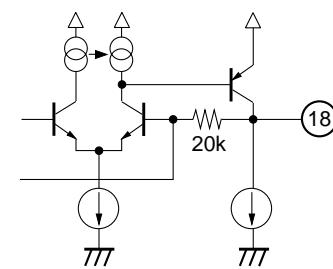

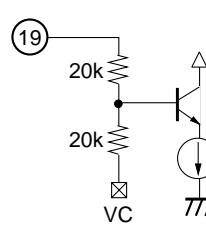

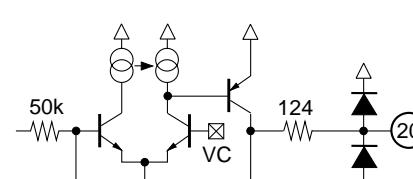

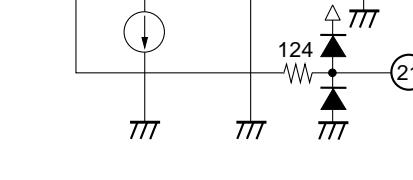

**Pin Description**

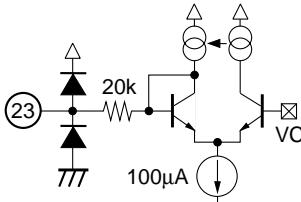

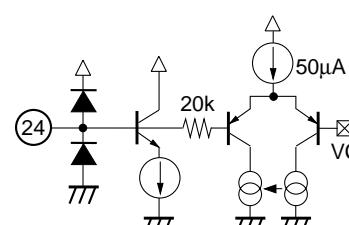

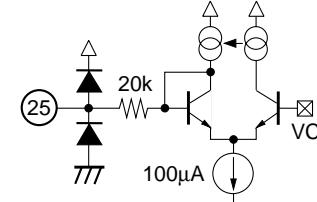

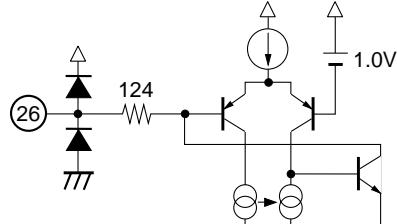

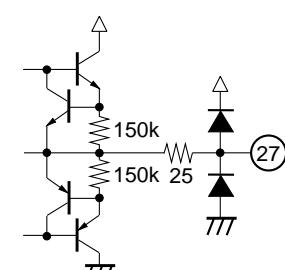

| Pin No. | Symbol  | I/O | Description  |
|---------|---------|-----|--|
| 1       | LD      | O   | APC amplifier output.                                |
| 2       | PD      | I   | APC amplifier input.                                 |

## Description of Functions

### • RFAC

The RF signal input by connecting capacitance to the EQ\_IN pin is equalized, arithmetically amplified and then output from the RFAC pin.

The EQ can be bypassed by connecting the BST control pin (Pin 24) to Vcc.

In this case only the EQ block enters sleep mode and low power consumption mode (slim mode) is activated.  
The low frequency gain is the same value as for EQ ON mode.

If RF (summing signal) is present at the pickup output pin, input the addition output signal to EQ\_IN (Pin 3) coupled by capacitance.

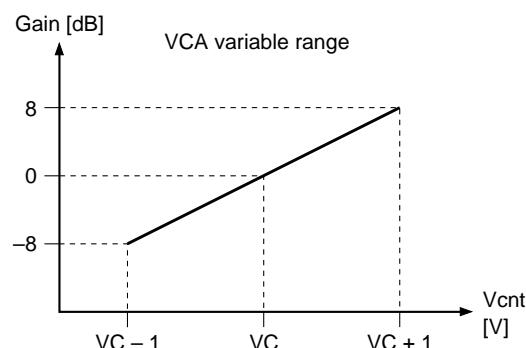

When using a pickup without a summing output function, perform addition with the AC SUM block and then input the signal to EQ\_IN (Pin 3) coupled by capacitance.

RW/RROM switching is done by the VCA block, so either input method can be used without problem.

The RW gain is 12dB higher than the ROM gain.

The VCA low frequency gain can be adjusted by the RFG (Pin 23) voltage.

The control voltage vs. low frequency gain characteristics are shown in the graph to the right.

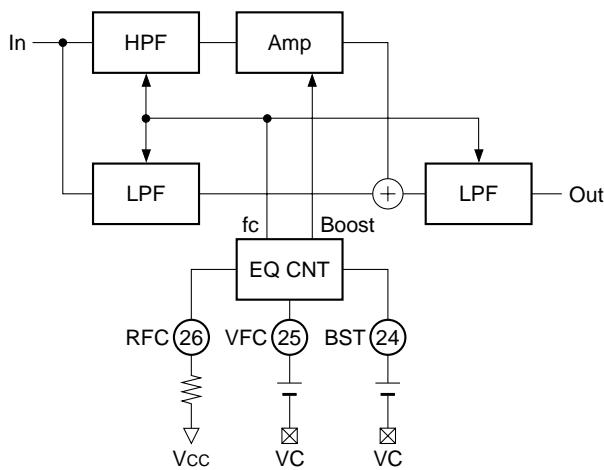

The RFAC pin (Pin 15) is an NPN transistor emitter follower output.

The maximum drive current is approximately 2mA.

If the load capacitance distorts the output waveform, connect resistance between Pin 15 and GND to increase the drive current.

- EQ

The diagram to the left shows the EQ internal block diagram.

The EQ consists of a combination of HPF and LPF. The HPF and LPF transmittance is the Bessel function. The boost gain can be adjusted by adjusting the HPF gain.

The boost frequency is adjusted by the RFC external resistance value and the VFC control voltage value.

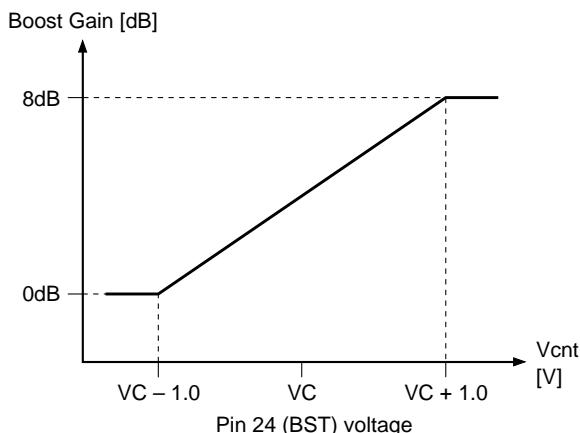

**RFC resistance value:** The cut-off frequency  $f_0$  of each filter is adjusted by the Pin 26 external resistance value.

The VFC voltage can be varied using this  $f_0$  as the reference.

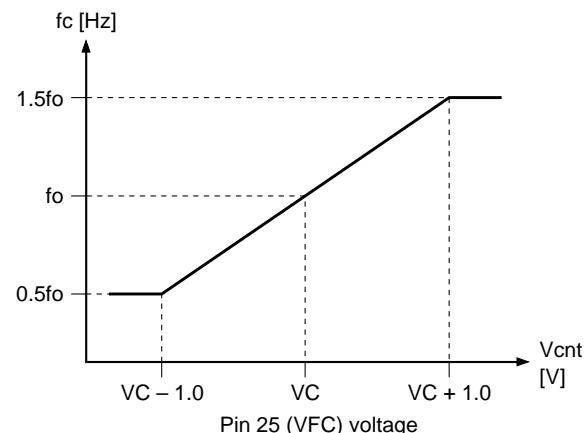

**VFC voltage:**  $f_0$  can be changed by the voltage applied to Pin 25.

The boost gain can be adjusted by the BST pin control voltage.

The control characteristics are shown in the graph below.

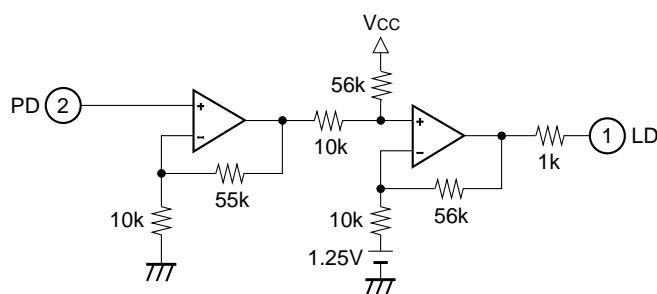

The cut-off frequency control characteristics are shown in the graph below.

- APC (Automatic Power Control)

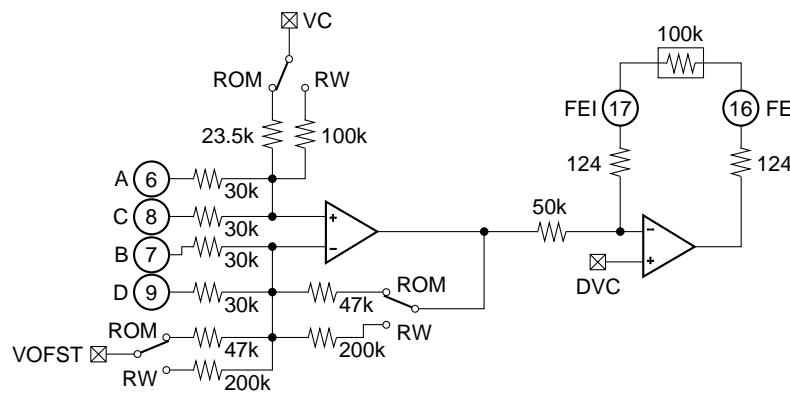

When the laser diode is driven by a constant current, the optical power output has extremely large negative temperature characteristics. Therefore, the current must be controlled to maintain the monitor photo diode output at a constant level. This control is performed by the APC function.

- Focus Error

The signals input to the A and C pins and the B and D pins are arithmetically amplified and the focus error signal is output.

This circuit has RW/ROM switching and offset addition functions.

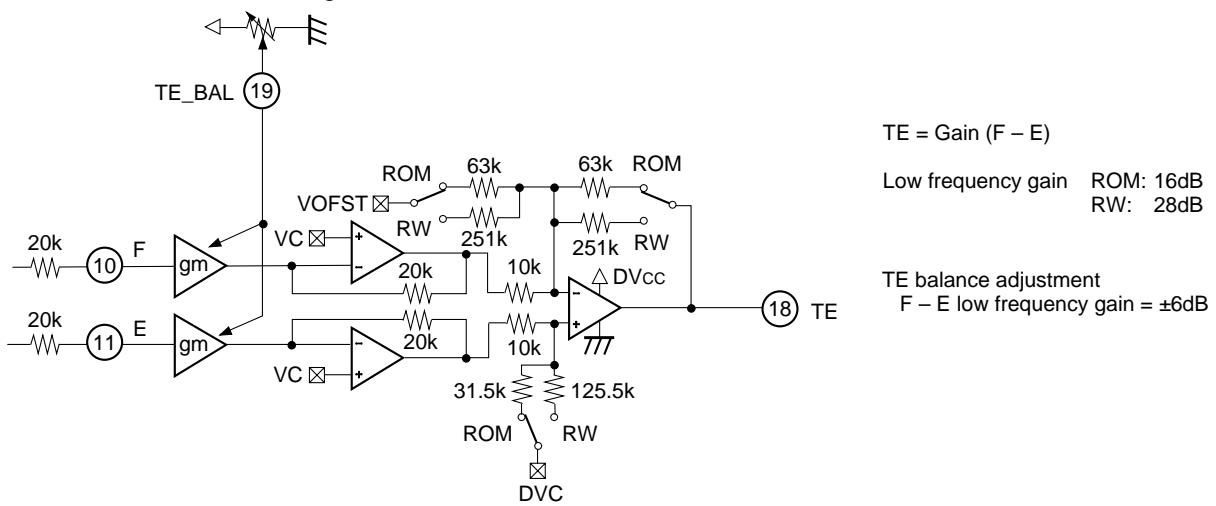

$$\text{FE} = \text{Gain} \{ (B + D) - (A + C) \}$$

Low frequency gain    ROM: 16dB  
                          RW: 28dB

Cut-off frequency  $f_c$  (typ.)    ROM: 300kHz  
    RW: 300kHz

- Tracking Error

The signals input to the E and F pins are arithmetically amplified and the tracking error signal is output.  
This circuit has RW/ROM switching and offset addition functions.

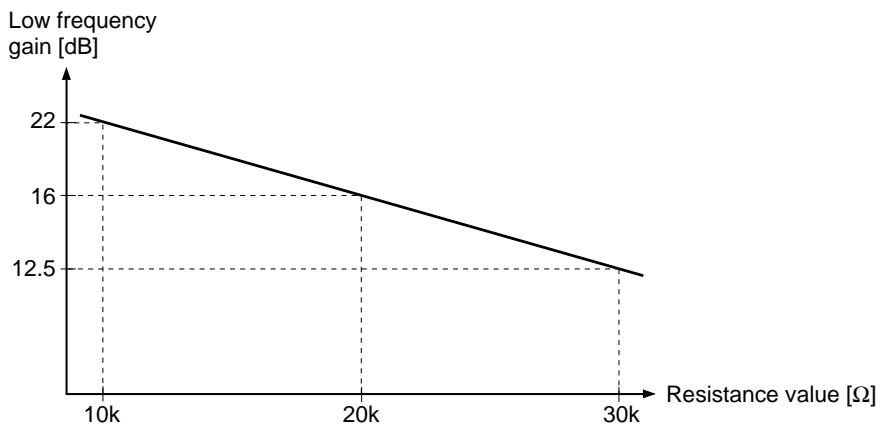

$$\text{TE} = \text{Gain} (F - E)$$

Low frequency gain    ROM: 16dB  
                          RW: 28dB

TE balance adjustment  
F - E low frequency gain = ±6dB

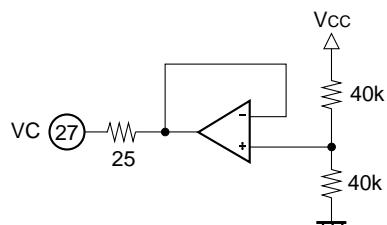

**External resistance value vs. Low frequency gain**

### • VC Buffer

This outputs the VC ((1/2) Vcc) voltage.

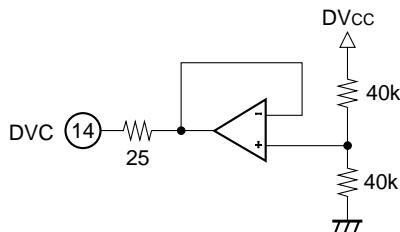

The maximum output current is approximately  $\pm 3\text{mA}$ .  
Use this voltage as the analog block VC voltage.

### • DVC Buffer

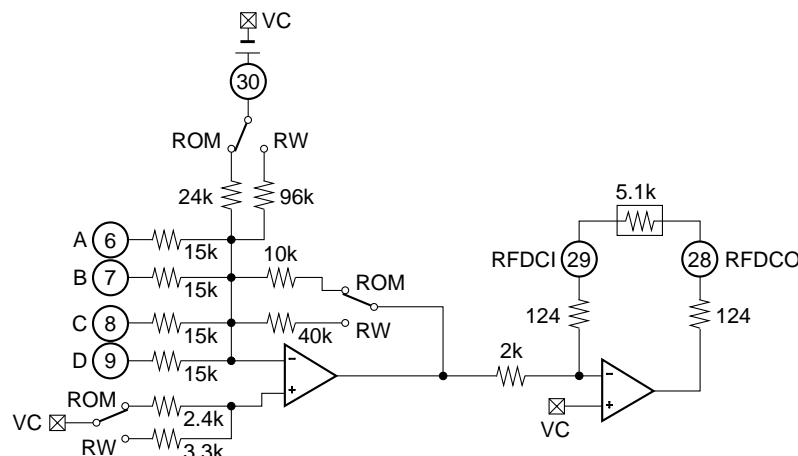

This outputs the 1/2 DVcc voltage.

The maximum output current is approximately  $\pm 3\text{mA}$ .  
Use this voltage as the digital block VC voltage.  
The output DC voltage of each block is level shifted using the DVC voltage as the reference.

### • RFDC

The signals input to the A, B, C and D pins are added, amplified and the RFDC signal is output. RW/ROM switching and low frequency gain adjustment are possible.

$$\text{RFDC} = \text{Gain} (A + B + C + D)$$

Low frequency gain ROM: 17.5dB

RW: 29.5dB

$f_c$  (Typ)

ROM: 20MHz

RW: 5MHz

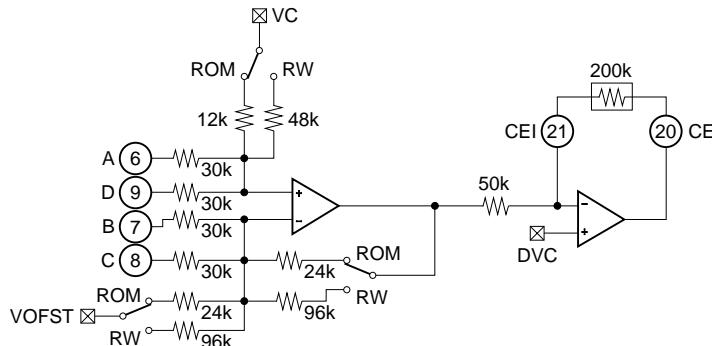

The gain can be adjusted by the external resistance connected between Pins 28 and 29.

The output voltage offset can be adjusted by controlling the Pin 30 voltage.

### • Center Error

The signals input to the A and D pins and the B and C pins are arithmetically amplified and the center error signal is output.

RW/ROM switching, low frequency gain adjustment and offset adjustment are possible.

The  $(B + C) - (A + D)$  signal is arithmetically amplified.

Low frequency gain    ROM: 16dB  
                          RW: 28dB

Cut-off frequency  $f_c$  (typ.)

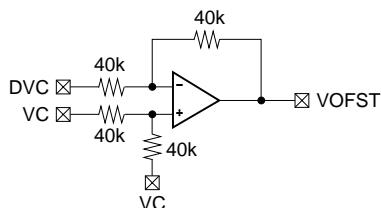

ROM: 200kHz  
RW: 200kHz

### • Output Offset Shift

The RFDC, FE, TE and CE output DC voltages are level shifted to the digital VC voltage (DVC).

The reference voltage of this IC is the VC voltage, and only the output reference voltage changes.

The maximum output voltage of each output signal should be kept to the digital Vcc voltage (DVcc) or less in order to protect the DSP\_IC.

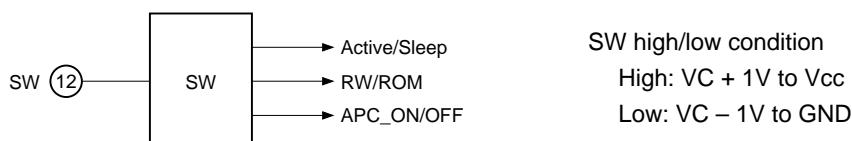

The VC and DVC voltages are arithmetically amplified and output as the VOFST voltage.

The VOFST voltage serves as the level shift reference voltage, and is distributed to each block.

### • SW

This controls the laser (APC) on/off, active/sleep mode, and RW/ROM mode switching.

Switching is controlled by the voltage applied to the SW pin.

The VC buffer is always in active mode even if it enters sleep mode.

In the function block, MODE\_SW is always set to active mode.

| Control voltage \ Item | APC | Active/Sleep | RW/ROM |
|------------------------|-----|--------------|--------|
| Vcc                    | ON  | Active       | RW     |
| VC or Hi-Z             | OFF | Sleep        | —      |
| GND                    | ON  | Active       | ROM    |

### Notes on Supply Voltage

**Vcc voltage value at which the waveform is clipped when DVcc is fixed**

The voltage difference between Vcc (Pin 22) and DVcc (Pin 13) should be kept to the value shown in the graph above or less.

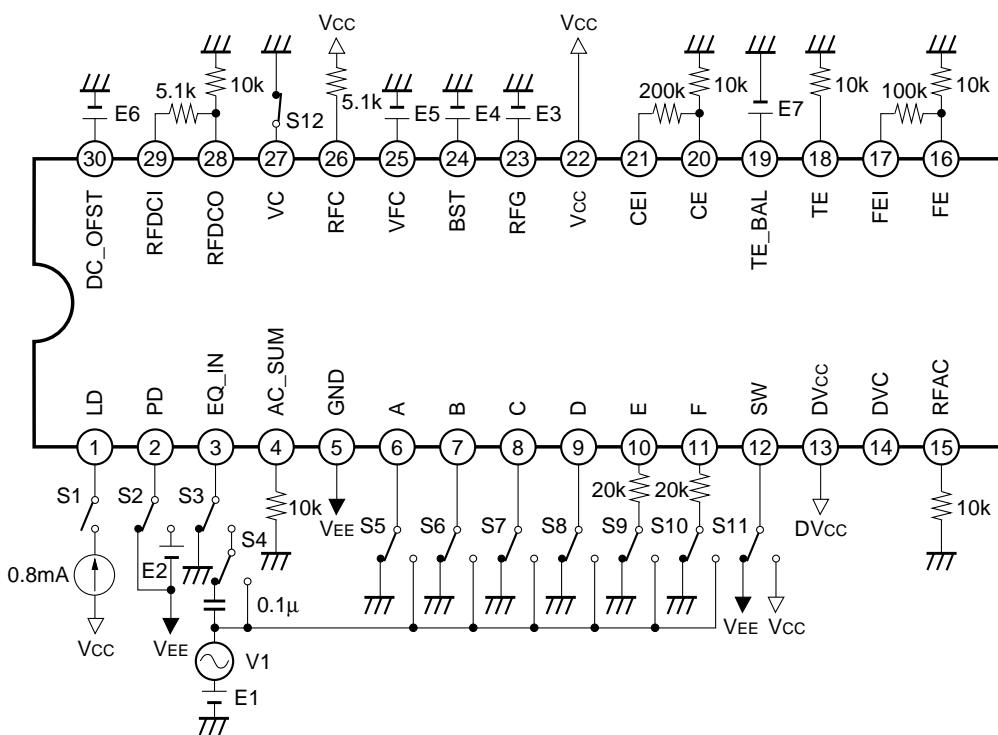

**Example)** When DVcc = 2.5V

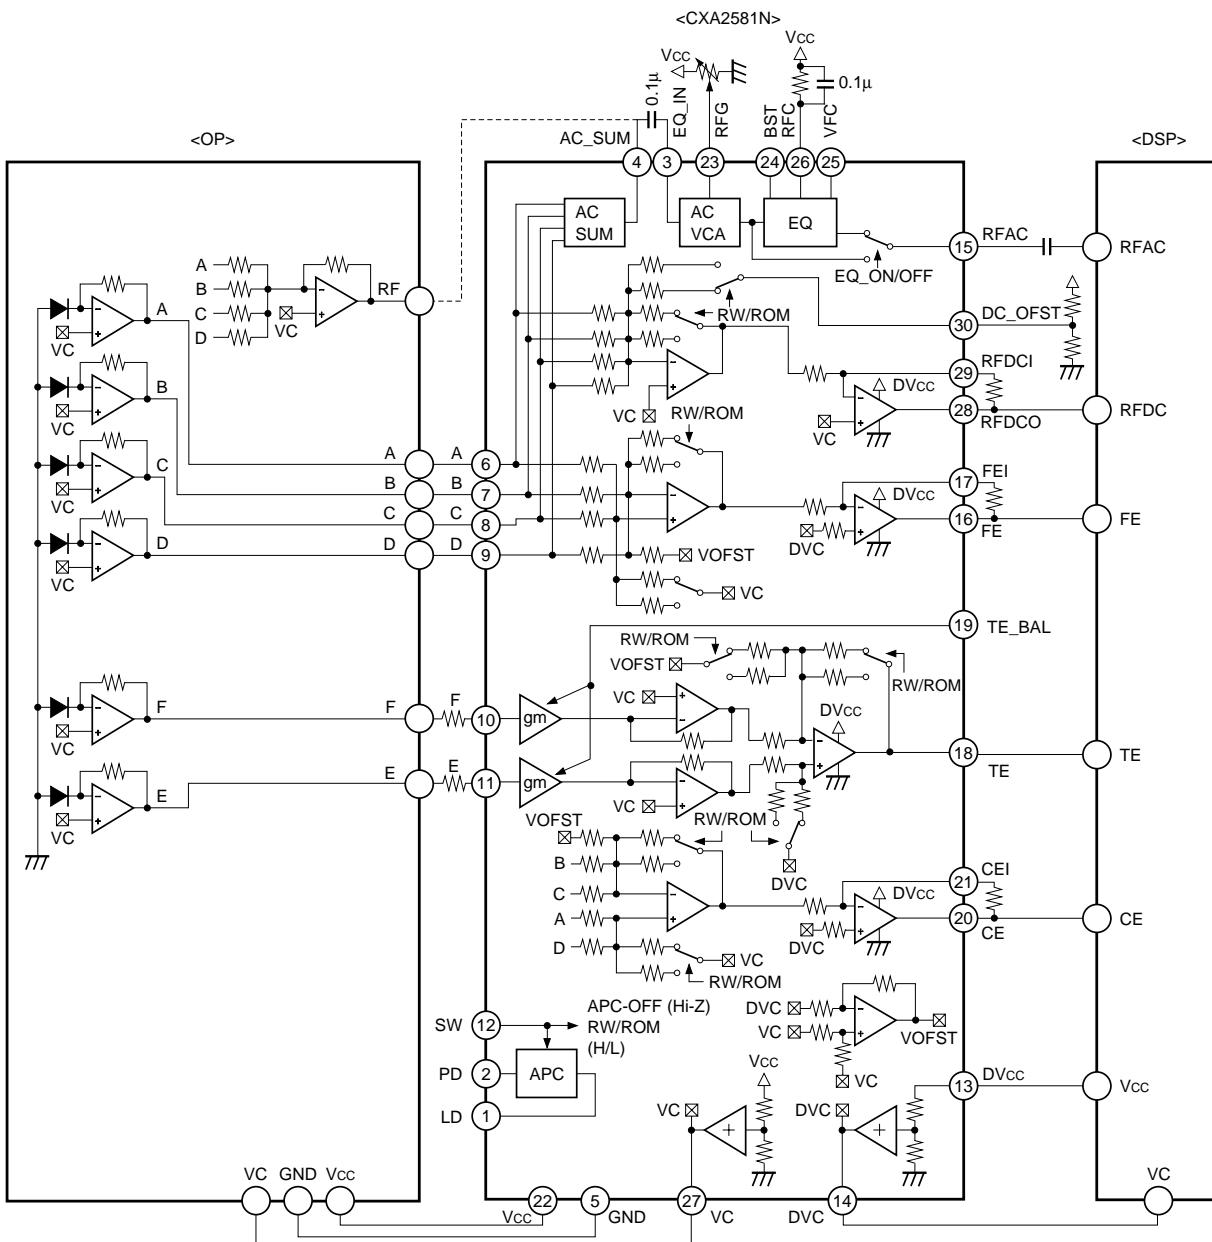

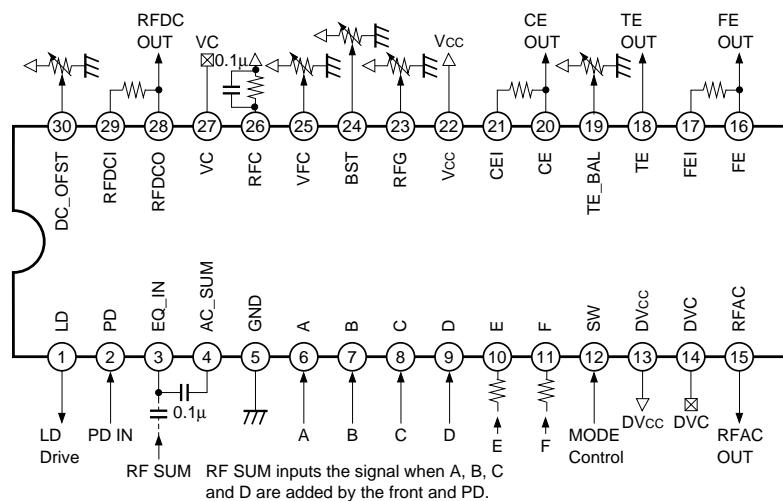

From the graph, Vcc = 4.5V

Therefore, Vcc should be from 3.4 to 4.5V.

(3.4V is the minimum operating voltage for the IC.)

### Electrical Characteristics Measurement Circuit

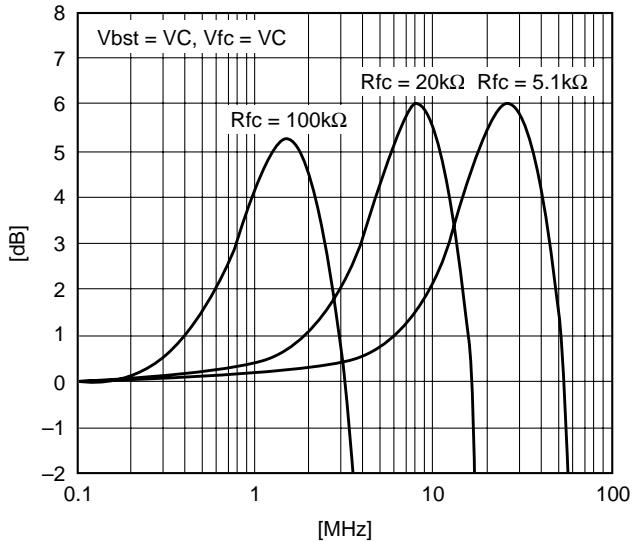

**Application Circuits**

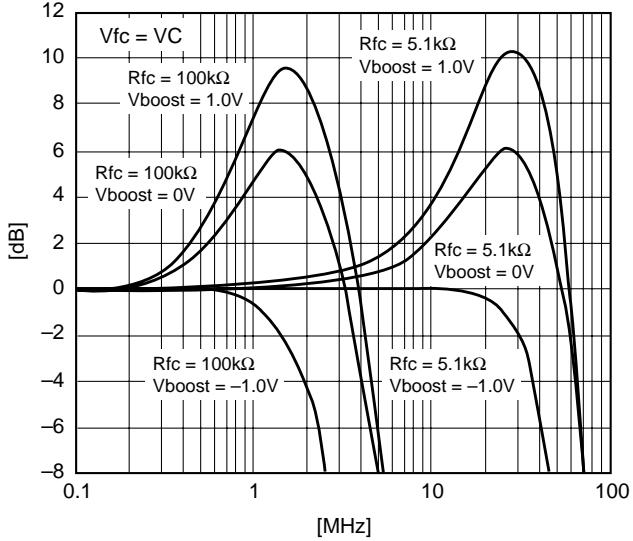

Application circuits shown are typical examples illustrating the operation of the devices. Sony cannot assume responsibility for any problems arising out of the use of these circuits or for any infringement of third party patent and other right due to same.

## Package Outline

Unit: mm

## PACKAGE STRUCTURE

|            |                |
|------------|----------------|
| SONY CODE  | SSOP-30P-L01   |
| EIAJ CODE  | SSOP030-P-0056 |
| JEDEC CODE | _____          |

|                  |                          |
|------------------|--------------------------|
| PACKAGE MATERIAL | EPOXY RESIN              |
| LEAD TREATMENT   | SOLDER/PALLADIUM PLATING |
| LEAD MATERIAL    | 42/COPPER ALLOY          |
| PACKAGE MASS     | 0.1g                     |

## NOTE : PALLADIUM PLATING

This product uses S-PdPPF (Sony Spec.-Palladium Pre-Plated Lead Frame).
