

Infrared Encoder/Decoder

FEATURES

- Supports with IrDA[®] Physical Layer Specification (version 1.3)
- UART to IR Encoder/Decoder
 - Interfaces with IrDA Compliant Transceivers
 - Used with any UART, including standard 16550 UART and microcontroller UART
- Transmit/Receive formats supported:
 - 1.63 μ s
- Hardware or Software Baud rate selection
 - Up to IrDA standard 115.2 kbaud operation
 - Up to 312.5 kbaud operation (at 20 MHz)
 - Low power mode

CMOS TECHNOLOGY

- Low-power, high-speed CMOS technology
- Fully static design
- Low voltage operation
- Commercial and Industrial temperature ranges
- Low power consumption
 - < 1 mA @ 3.3V, 8 MHz (typical)
 - 3 μ A typical @ 5.0V when disabled

MCP2120

NOTES:

1.0 DEVICE OVERVIEW

This document contains device specific information for the following device:

- MCP2120

This device is a low-cost, high-performance, fully-static infrared encoder/decoder. This device sits between a UART and an infrared (IR) optical transceiver.

The data received from a standard UART is encoded (modulated), and output as electrical pulses to the IR Transceiver. The IR Transceiver also receives data which it outputs as electrical pulses. The MCP2120 decodes (demodulates) these electrical pulses and then the data is transmitted by the MCP2120 UART. This modulation and demodulation method is performed in accordance with the IrDA standard.

Typically a microcontroller interfaces to the IR encoder/decoder.

Infrared communication is a wireless two-way data connection using infrared light generated by low-cost transceiver signaling technology. This provides reliable communication between two devices.

Infrared technology offers:

- Universal standard for connecting portable computing devices
- Easy, effortless implementation
- Economical alternative to other connectivity solutions
- Reliable, high speed connection
- Safe to use in any environment; can even be used during air travel
- Eliminates the hassle of cables
- Allows PC's and non-PC's to communicate to each other
- Enhances mobility by allowing users to easily connect

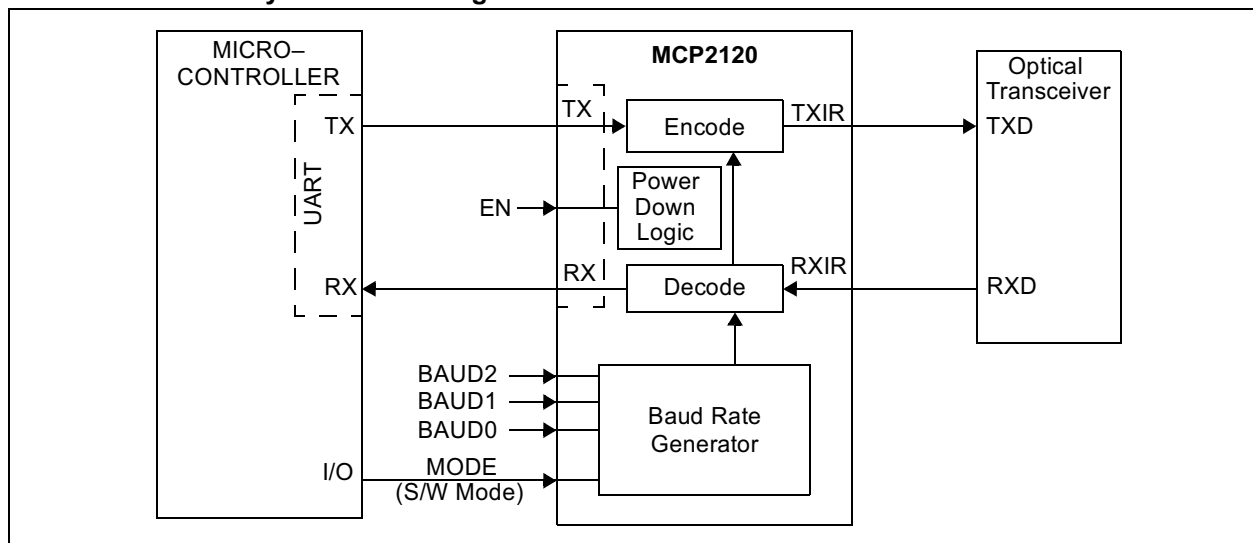

1.1 Applications

The MCP2120 is a stand-alone IrDA Encoder/Decoder product. Figure 1-1 shows a typical application block diagram. Table 1-2 shows the pin definitions in the user (normal) mode of operation.

TABLE 1-1: MCP2120 FEATURES OVERVIEW

Features	MCP2120
Serial Communications:	UART, IR
Baud Rate Selection:	Hardware/Software
Low Power Mode:	Yes
Resets: (and Delays)	Wake-up (DRT)
Packages:	14-pin DIP 14-pin SOIC

FIGURE 1-1: System Block Diagram

MCP2120

TABLE 1-2: PIN DESCRIPTION USER MODE

Pin Name	Pin Number		Pin Type	Buffer Type	Description
	PDIP	SOIC			
VDD	1	1	—	P	Positive supply for logic and I/O pins
OSC1/ CLKIN	2	2	I	CMOS	Oscillator crystal input/external clock source input
OSC2	3	3	O	—	Oscillator crystal Output
RESET	4	4	I	ST	Resets the Device
RXIR	5	5	I	ST	Asynchronous receive from infrared transceiver
TXIR	6	6	O	—	Asynchronous transmit to infrared transceiver
MODE	7	7	I	TTL	Selects the device mode (Data/Command) for Software Baud Rate operation. For more information see Section 2.4.1.2 .
BAUD2	8	8	I	TTL	BAUD2:BAUD0 specify the Baud rate of the device, or if the device operates in Software Baud Rate mode. For more information see Section 2.4.1 .
BAUD1	9	9	I	TTL	
BAUD0	10	10	I	TTL	
RX	11	11	O	—	Asynchronous transmit to controller UART
TX	12	12	I	TTL	Asynchronous receive from controller UART
EN	13	13	I	—	Device Enable.
Vss	14	14	—	P	Ground reference for logic and I/O pins

Legend: TTL = TTL compatible input ST = Schmitt Trigger input with CMOS levels
I = Input O = Output
P = Power CMOS = CMOS compatible input

2.0 DEVICE OPERATION

The MCP2120 is a low cost infrared Encoder/Decoder. The baud rate is user selectable to standard IrDA baud rates between 9600 baud to 115.2 kbaud. The maximum baud rate is 312.5 kbaud.

2.1 Power-up

Any time that the device is powered up, the Device Reset Timer delay ([parameter 32](#)) must occur before any communication with the device is initiated. This is from both the infrared transceiver side as well as the controller UART interface.

2.2 Device Reset

The MCP2120 is forced into the reset state when the $\overline{\text{RESET}}$ pin is in the low state. After the $\overline{\text{RESET}}$ pin is brought to a high state, the Device Reset Timer occurs. Once the DRT times out, normal operation occurs.

2.3 Bit Clock

The device crystal is used to derive the communication bit clock (BITCLK). There are 16 BITCLKs for each bit time. The BITCLKs are used for the generation of the Start bit and the eight data bits. The Stop bit uses the BITCLK when the data is transmitted (not for reception).

This clock is a fixed frequency, and has minimal variation in frequency (specified by crystal manufacturer).

2.4 UART Interface

The UART interface communicates with the "controller". This interface is a Half duplex interface, meaning that the system is either transmitting or receiving, but not both at the same time.

2.4.1 BAUD RATE

The baud rate for the MCP2120 can be configured either by the state of three hardware pins (BAUD2, BAUD1, and BAUD0) or through software selection.

2.4.1.1 Hardware Selection

Three device pins are used to select the baud rate that the MCP2120 will transmit and receive data. These pins are called BAUD2, BAUD1, and BAUD0. There is one pin state (device mode) where the application software can specify the baud rate. [Table 2-1](#) shows the baud rate configurations.

TABLE 2-1: HARDWARE BAUD RATE SELECTION VS. FREQUENCY

BAUD2:BAUD0	Frequency (MHz)							Bit Rate
	0.6144 ⁽¹⁾	2.000	3.6864	4.9152	7.3728	14.7456 ⁽²⁾	20.000 ⁽²⁾	
000	800	2604	4800	6400	9600	19200	26042	Fosc / 768
001	1600	5208	9600	12800	19200	38400	52083	Fosc / 384
010	3200	10417	19200	25600	38400	78600	104167	Fosc / 192
011	4800	15625	28800	38400	57600	115200	156250	Fosc / 128
100	9600	31250	57600	78600	115200	230400	312500	Fosc / 64

Note 1: An external clock is recommended for frequencies below 2 MHz.

2: For frequencies above 7.5 MHz, the TXIR pulse width ([parameter IR121](#)) will be shorter than the minimum pulse width of 1.6 μs in the IrDA standard specification.

MCP2120

2.4.1.2 Software Selection

When the BAUD2:BAUD0 pins are configured as '111' the MCP2120 defaults to a baud rate of $F_{osc} / 768$.

To place the MCP2120 into Command Mode, the MODE pin must be at a low level. When in this mode, any data that is received by the MCP2120's UART is "echoed" back to the controller and no encoding/decoding occurs. The echoed data will be skewed less than 1 bit time (see [parameter IR141](#)). When the MODE pin goes high, the device is returned to Data Mode where the encoder/decoder is in operation.

[Table 2-2](#) shows the software hex commands to configure the MCP2120's baud rate.

The MCP2120 receives data bytes at the existing baud rate. When the change baud rate command (0x11) is received, the last valid baud rate value received becomes the new baud rate. The new baud rate is effective after the stop bit of the echoed data. [Figure 2-2](#) shows this sequence.

2.4.2 TRANSMITTING

When the controller sends serial data to the MCP2120, the baud rates are required to match.

There will be some jitter on the detection of the high to low edge of the start bit. This jitter will affect the placement of the encoded start bit. All subsequent bits will be 16 BITCLK times later.

2.4.3 RECEIVING

When the controller receives serial data from the MCP2120, the baud rates are required to match.

There will be some jitter on the detection of the high to low edge of the start bit. This jitter will affect the placement of the decoded Start bit. All subsequent bits will be 16 BITCLK times later.

FIGURE 2-1: Data/Command Mode Flow

TABLE 2-2: SOFTWARE BAUD RATE SELECTION VS. FREQUENCY

Hex Command ^(3, 4)	Frequency (MHz)							Bit Rate
	0.6144 ⁽¹⁾	2.000	3.6864	4.9152	7.3728	14.7456 ⁽²⁾	20.000 ⁽²⁾	
0x87	800	2604	4800	6400	9600	19200	26042	$F_{osc} / 768$
0x8B	1600	5208	9600	12800	19200	38400	52083	$F_{osc} / 384$
0x85	3200	10417	19200	25600	38400	78600	104167	$F_{osc} / 192$
0x83	4800	15625	28800	38400	57600	115200	156250	$F_{osc} / 128$
0x81	9600	31250	57600	78600	115200	230400	312500	$F_{osc} / 64$

- Note 1:** An external clock is recommended for frequencies below 2 MHz.
- 2:** For frequencies above 7.3728 MHz, the TXIR pulse width ([parameter IR121](#)) will be shorter than the 1.6 μs IrDA standard specification.
- 3:** Command 0x11 is used to change to the new baud rate.
- 4:** All other command codes are reserved for possible future use.

2.5 Modulation

When the UART receives data to be transmitted, the data needs to be modulated. This modulated signal drives the IR transceiver module. Figure 2-2 shows the encoding of the modulated signal.

Each bit time is comprised of 16-bit clocks. If the value to be transmitted (as determined by the TX pin) is a logic low, then the TXIR pin will output a low level for 7-bit clock cycles, a logic high level for 3-bit clock cycles, and then the remaining 6-bit clock cycles will be low. If the value to transmit is a logic high, then the TXIR pin will output a low level for the entire 16-bit clock cycles.

2.6 Demodulation

The modulated signal from the IR transceiver module needs to be demodulated to form the received data. As demodulation occurs, the bit value is placed on the RX pin in UART format. Figure 2-3 shows the decoding of the modulated signal.

Each bit time is comprised of 16 bit clocks. If the value to be received is a logic low, then the RXIR pin will be a low level for the first 3-bit clock cycles, and then the remaining 13-bit clock cycles will be high. If the value to be received is a logic high, then the RXIR pin will be a high level for the entire 16-bit clock cycles. The level on the RX pin will be in the appropriate state for the entire 16 clock cycles.

FIGURE 2-2: Encoding

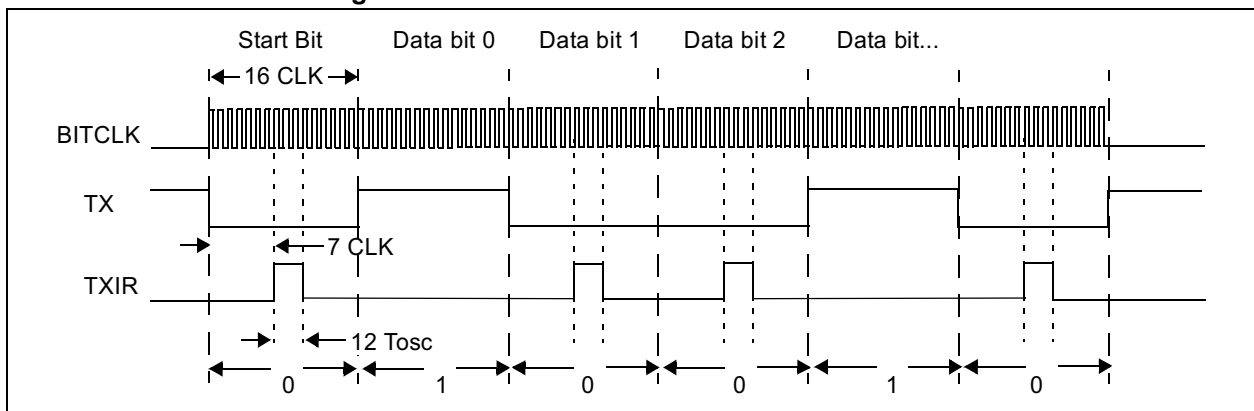

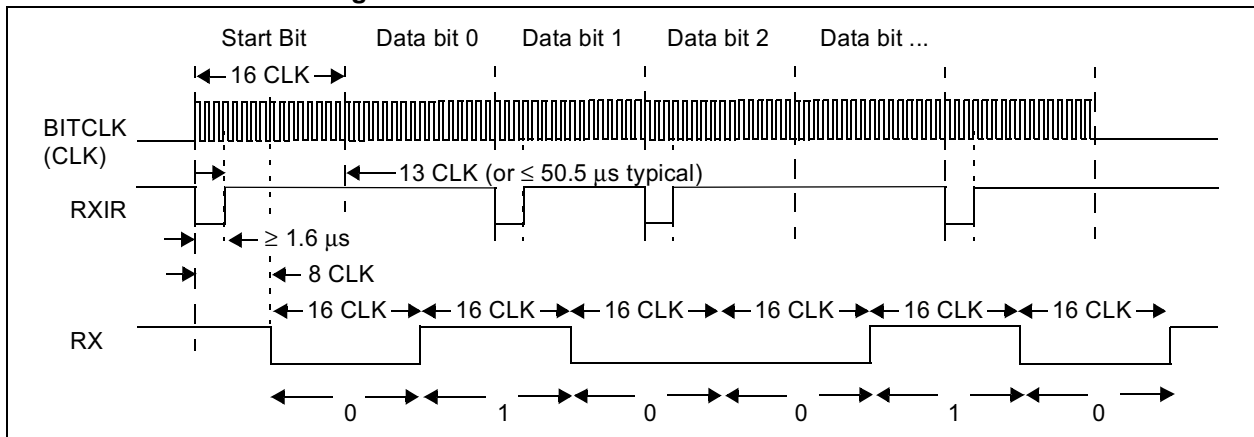

FIGURE 2-3: Decoding

MCP2120

2.7 Encoding/Decoding Jitter and Offset

Figure 2-4 shows the jitter and offset that is possible on the RX pin and the TXIR pin.

Jitter is the possible variation of the desired edge.

Offset is the propagation delay of the input signal (RXIR or TX) to the output signal (RX or TXIR).

The first bit on the output pin (on RX or TXIR) will show jitter compared to the input pin (RXIR or TX), but all remaining bits will be a constant distance.

2.8 Minimizing Power

The device can be placed in a low power mode by disabling the device (holding the EN pin at the low state). The internal state machine is monitoring this pin for a low level, and once this is detected the device is disabled and enters into a low power state.

2.8.1 RETURNING TO OPERATION

When the device is disabled, the device is in a low power state. When the EN pin is brought to a high level, the device will return to the operating mode. The device requires a delay of 1000 TOSC before data may be transmitted or received.

FIGURE 2-4: Effects of Jitter and Offset

3.0 DEVELOPMENT TOOLS

The MCP2120 is supported by the MCP2120/MCP2150 Developer's Kit (order number DV163008). This kit allows the user to demonstrate the operation of the MCP2120.

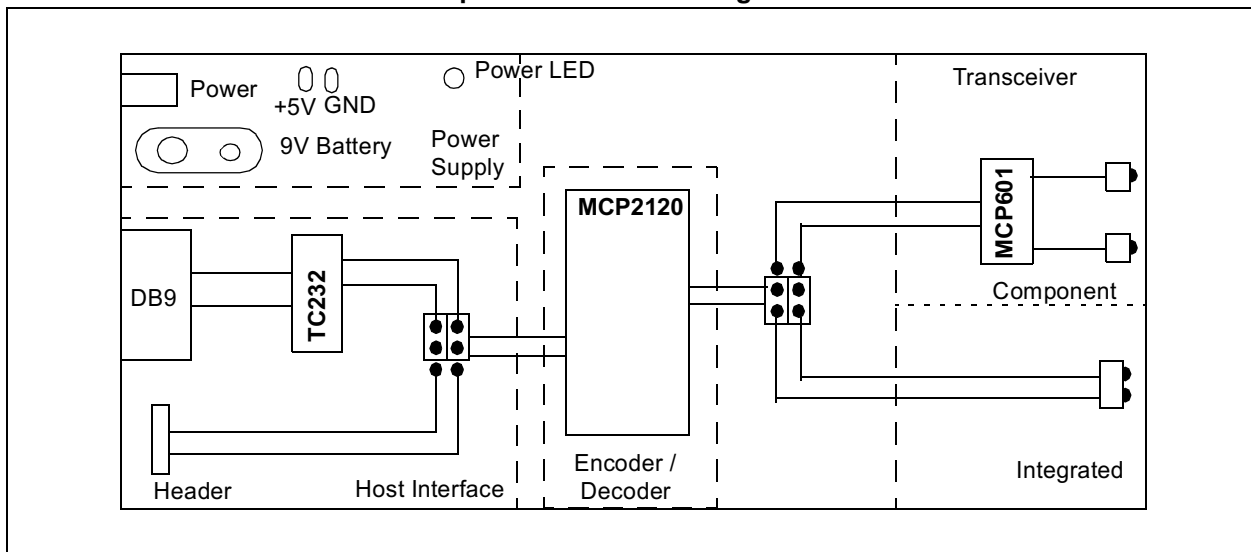

Figure 3-1 shows a block diagram of the MCP2120 Development Board. As can be seen, the user has jumper options for both the interface to the host controller (UART or Header) and the transceiver solution (intergrated or component).

The UART interface allows a direct connection to a PC (use a terminal emulation program) or a header which allows easy connections to host prototypes (or one of the PICDEM™ boards).

The transceiver solutions allow the selection either of a single chip transceiver solution, or a minimal component solution. This component solution allows a lower system cost to be achieved. With the lower cost comes some trade-offs of the IrDA standard physical layer specifications. These trade-offs need to be evaluated to ensure the characteristics of the component solution meet the requirements of the system.

This kit comes with two identical MCP2120 Development Boards and a single MCP2150 Developer's board. This allows a complete system (Transmitter and Receiver) to be implemented with either system requirement (simple encoder/decoder or IrDA standard protocol stack plus encoder/decoder).

FIGURE 3-1: MCP2120 Developer's Board Block Diagram

MCP2120

NOTES:

4.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings†

Ambient Temperature under bias	-40°C to +125°C
Storage Temperature	-65°C to +150°C
Voltage on VDD with respect to VSS	0 to +7V
Voltage on RESET with respect to VSS	0 to +14V
Voltage on all other pins with respect to VSS	-0.6V to (VDD + 0.6V)
Total Power Dissipation ⁽¹⁾	700 mW
Max. Current out of VSS pin	150 mA
Max. Current into VDD pin	125 mA
Input Clamp Current, I _{IK} (V _I < 0 or V _I > VDD)	±20 mA
Output Clamp Current, I _{OK} (V _O < 0 or V _O > VDD).....	±20 mA
Max. Output Current sunk by any Output pin.....	25 mA
Max. Output Current sourced by any Output pin.....	25 mA

Note 1: Power Dissipation is calculated as follows:

$$P_{DIS} = V_{DD} \times \{I_{DD} - \sum I_{OH}\} + \sum \{(V_{DD} - V_{OH}) \times I_{OH}\} + \sum (V_{OL} \times I_{OL})$$

†NOTICE: Stresses above those listed under "Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

D004	SVDD	VDD Rise Rate to ensure Power-on Reset	0.05	—	—	V/ms	
D010	IDD	Supply Current ⁽³⁾	—	0.8	1.4	mA	FOSC = 4 MHz, VDD = 5.5V
			—	0.6	1.0	mA	FOSC = 4 MHz, VDD = 3.0V
			—	0.4	0.8	mA	FOSC = 4 MHz, VDD = 2.5V
			—	3	7	mA	FOSC = 10 MHz, VDD = 3.0V
			—	4	12	mA	FOSC = 20 MHz, VDD = 4.5V
			—	4.5	16	mA	FOSC = 20 MHz, VDD = 5.5V
D020	IPD	Device Disabled Current ^(3, 4)	—	0.25	4	μA	VDD = 3.0V, $0^{\circ}\text{C} \leq T_A \leq +70^{\circ}\text{C}$
			—	0.25	3	μA	VDD = 2.5V, $0^{\circ}\text{C} \leq T_A \leq +70^{\circ}\text{C}$
			—	0.4	5.5	μA	VDD = 4.5V, $0^{\circ}\text{C} \leq T_A \leq +70^{\circ}\text{C}$
			—	3	8	μA	VDD = 5.5V, $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$

Note 1: Data in the Typical ("Typ") column is based on characterization results at 25°C. This data is for design guidance only and is not tested.

2: This is the limit to which VDD can be lowered without losing RAM data.

3: The supply current is mainly a function of the operating voltage and frequency. Pin loading, pin rate, and temperature have an impact on the current consumption.

a) The test conditions for all IDD measurements are made when device is enabled (EN pin is high):
OSC1 = external square wave, from rail-to-rail; all input pins pulled to VSS, RXIR = VDD, RESET = VDD;

b) When device is disabled (EN pin is low), the conditions for current measurements are the same.

4: When the device is disabled (EN pin is low), current is measured with all input pins tied to VDD or VSS and the output pins driving a high or low level into infinite impedance.

MCP2120

4.3 Timing Diagrams and Specifications

FIGURE 4-3: External Clock Timing

TABLE 4-3: EXTERNAL CLOCK TIMING REQUIREMENTS

AC Characteristics			Standard Operating Conditions (unless otherwise specified) Operating Temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ (industrial) Operating Voltage VDD range is described in Section 4.1				
Param. No.	Sym	Characteristic	Min	Typ ⁽¹⁾	Max	Units	Conditions
1	TOSC	External CLKIN Period (2,3)	50	—	—	ns	
		Oscillator Period (2)	50	—	500	ns	
1A	FOSC	External CLKIN Frequency (2,3)	DC	—	20	MHz	
		Oscillator Frequency (2)	2	—	20	MHz	
1C	ECLK	Clock Error	—	—	0.01	%	
3	TosL, TosH	Clock in (OSC1) Low or High Time	10	—	—	ns	
4	TosR, TosF	Clock in (OSC1) Rise or Fall Time	—	—	15	ns	

Note 1: Data in the Typical (“Typ”) column is at 5V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

2: All specified values are based on characterization data for that particular oscillator type under standard operating conditions with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption. When an external clock input is used, the “max” cycle time limit is “DC” (no clock) for all devices.

3: A duty cycle of no more than 60/40 (High Time / Low Time or Low Time / High Time) is recommended for external clock inputs.

5.0 DC AND AC CHARACTERISTICS GRAPHS AND TABLES

The graphs and tables provided in this section are for design guidance and are not tested. In some graphs or tables the data presented is outside specified operating range (e.g., outside specified VDD range). This is for information only and devices will operate properly only within the specified range.

The data presented in this section is a statistical summary of data collected on units from different lots over a period of time. "Typical" represents the mean of the distribution while "max" or "min" represents (mean + 3 σ) and (mean - 3 σ) respectively, where σ is standard deviation.

6.0 PACKAGING INFORMATION

6.1 Package Marking Information

14-Lead PDIP (300 mil)

Example:

14-Lead SOIC (150 mil)

Example:

Legend:	XX...X	Customer specific information*
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code
Note:	In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line thus limiting the number of available characters for customer specific information.	

- * Standard OTP marking consists of Microchip part number, year code, week code, and traceability code. For OTP marking beyond this, certain price adders apply. Please check with your Microchip Sales Office. For QTP devices, any special marking adders are included in QTP price.

NOTES:

ON-LINE SUPPORT

Microchip provides on-line support on the Microchip World Wide Web (WWW) site.

The web site is used by Microchip as a means to make files and information easily available to customers. To view the site, the user must have access to the Internet and a web browser, such as Netscape or Microsoft Explorer. Files are also available for FTP download from our FTP site.

Connecting to the Microchip Internet Web Site

The Microchip web site is available by using your favorite Internet browser to attach to:

www.microchip.com

The file transfer site is available by using an FTP service to connect to:

<ftp://ftp.microchip.com>

The web site and file transfer site provide a variety of services. Users may download files for the latest Development Tools, Data Sheets, Application Notes, User's Guides, Articles and Sample Programs. A variety of Microchip specific business information is also available, including listings of Microchip sales offices, distributors and factory representatives. Other data available for consideration is:

- Latest Microchip Press Releases
- Technical Support Section with Frequently Asked Questions
- Design Tips
- Device Errata
- Job Postings
- Microchip Consultant Program Member Listing
- Links to other useful web sites related to Microchip Products
- Conferences for products, Development Systems, technical information and more
- Listing of seminars and events

Systems Information and Upgrade Hot Line

The Systems Information and Upgrade Line provides system users a listing of the latest versions of all of Microchip's development systems software products. Plus, this line provides information on how customers can receive any currently available upgrade kits. The Hot Line Numbers are:

1-800-755-2345 for U.S. and most of Canada, and
1-480-792-7302 for the rest of the world.

013001

MCP2120

READER RESPONSE

It is our intention to provide you with the best documentation possible to ensure successful use of your Microchip product. If you wish to provide your comments on organization, clarity, subject matter, and ways in which our documentation can better serve you, please FAX your comments to the Technical Publications Manager at (480) 792-4150.

Please list the following information, and use this outline to provide us with your comments about this Data Sheet.

To: Technical Publications Manager Total Pages Sent
RE: Reader Response
From: Name _____
Company _____
Address _____
City / State / ZIP / Country _____
Telephone: (_____) _____ - _____ FAX: (_____) _____ - _____

Application (optional):

Would you like a reply? ___Y ___N

Device: **MCP2120** Literature Number: **DS21618A**

Questions:

1. What are the best features of this document?

2. How does this document meet your hardware and software development needs?

3. Do you find the organization of this data sheet easy to follow? If not, why?

4. What additions to the data sheet do you think would enhance the structure and subject?

5. What deletions from the data sheet could be made without affecting the overall usefulness?

6. Is there any incorrect or misleading information (what and where)?

7. How would you improve this document?

8. How would you improve our software, systems, and silicon products?

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

<u>PART NO.</u>	<u>X</u>	<u>/XX</u>
Device	Temperature Range	Package
Device	MCP2120: Infrared Encoder/Decoder	
Temperature Range	I	= -40°C to +85°C
Package	P	= Plastic DIP (300 mil, Body), 14-lead
	SL	= Plastic SOIC (150 mil, Body), 14-lead

Examples:

- a) MCP2120-I/P = Industrial Temp., PDIP packaging
- b) MCP2120-I/SL = Industrial Temp., SOIC package
- c) MCP2120T-I/SL = Tape and Reel, Industrial Temp., SOIC package

Sales and Support

Data Sheets

Products supported by a preliminary Data Sheet may have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

1. Your local Microchip sales office
2. The Microchip Corporate Literature Center U.S. FAX: (480) 792-7277
3. The Microchip Worldwide Site (www.microchip.com)

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.

New Customer Notification System

Register on our web site (www.microchip.com/cn) to receive the most current information on our products.

Microchip received QS-9000 quality system certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona in July 1999. The Company's quality system processes and procedures are QS-9000 compliant for its PICmicro® 8-bit MCUs, KEELoQ® code hopping devices, Serial EEPROMs and microperipheral products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001 certified.
