## TA2024 - PREMILINARY

## STEREO 15 W (4 $\Omega$ ) CLASS-T ${ }^{\text {TM }}$ DIGITAL AUDIO AMPLIFIER USING DIGITAL POWER PROCESSING ${ }^{\text {TM }}$ TECHNOLOGY

## GENERAL DESCRIPTION

The TA2024 is a $15 \mathrm{~W} / \mathrm{ch}$ continuous average two-channel Class-T Digital Audio Power Amplifier IC using Tripath's proprietary Digital Power Processing ${ }^{\top M}$ technology. Class-T amplifiers offer both the audio fidelity of Class-AB and the power efficiency of Class-D amplifiers.

## APPLICATIONS

> Computer/PC Multimedia
> DVD Players
> Cable Set-Top Products
> Televisions
> Video CD Players
> Battery Powered Systems

## BENEFITS

$>$ Fully integrated solution with FETs
$>$ Easier to design-in than Class-D
$>$ Reduced system cost with no heat sink
> Dramatically improves efficiency versus ClassAB
> Signal fidelity equal to high quality linear amplifiers
> High dynamic range compatible with digital media such as CD, DVD, and Internet audio

TYPICAL PERFORMANCE

## FEATURES

$>$ Class-T architecture
$>$ Single Supply Operation
> "Audiophile" Quality Sound
$>0.04 \%$ THD+N @ $9 \mathrm{~W}, 4 \Omega$
$>0.18 \%$ IHF-IM @ $1 \mathrm{~W}, 4 \Omega$
> 11W @ 4
$>6 \mathrm{~W} @ 8 \Omega, 0.1 \%$ THD+N
> High Power
> $15 \mathrm{~W} @ 4 \Omega, 10 \%$ THD+N
$>10 \mathrm{~W} @ 8 \Omega, 10 \%$ THD+N
> High Efficiency
> 81\%@15W,4
> 88\% @ 10W, 8
$>$ Dynamic Range $=102 \mathrm{~dB}$
$>$ Mute and Sleep inputs
> Turn-on \& turn-off pop suppression
$>$ Over-current protection
$>$ Over-temperature protection
$>$ Bridged outputs
> 36-pin Power SOP package

ABSOLUTEMAXIMUM RATINGS (Note 1)

| SYMBOL | PARAMETER | Value | UNITS |
| :--- | :--- | :---: | :---: |
| $V_{\text {DD }}$ | Supply Voltage | 16 | V |
| V5 | Input Section Supply Voltage | 6.0 | V |
| SLEEP | SLEEP Input Voltage | -0.3 to 6.0 | V |
| MUTE | MUTE Input Voltage | -0.3 to $\mathrm{V} 5+0.3$ | V |
| $T_{\text {STORE }}$ | Storage Temperature Range | -40 to 150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\mathrm{A}}$ | Operating Free-air Temperature Range | 0 to 70 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{J}$ | Junction Temperature | 150 | ${ }^{\circ} \mathrm{C}$ |

Note 1: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Note 2 : See Power Dissipation Derating in the Applications Information section.

OPERATING CONDITIONS (Note 4)

| SYMBOL | PARAMETER | MIN. | TYP. | MAX. | UNITS |
| :--- | :--- | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\mathrm{DD}}$ | Supply Voltage | 8.5 | 12 | 13.2 | V |
| $\mathrm{~V}_{\mathrm{IH}}$ | High-level Input Voltage (MUTE, SLEEP) | 3.5 |  |  | V |
| $\mathrm{~V}_{\mathrm{IL}}$ | Low-level Input Voltage (MUTE, SLEEP) |  |  | 1 | V |

Note 3: Recommended Operating Conditions indicate conditions for which the device is functional. See Electrical Characteristics for guaranteed specific performance limits.

## ELECTRICALCHARACTERISTICS

See Test/Application Circuit. Unless otherwise specified, $V_{D D}=12 \mathrm{~V}, \mathrm{f}=1 \mathrm{kHz}$, Measurement Bandwidth $=22 \mathrm{kHz}, \mathrm{R}_{\mathrm{L}}=4 \Omega, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$, Package heat slug soldered to 2.8 square-inch PC pad.

| SYMBOL | PARAMETER | CONDITIONS | MIN. | TYP. | MAX. | UNITS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Po | Output Power (Continuous Average/Channel) | THD $+\mathrm{N}=0.1 \%$ $\mathrm{R}_{\mathrm{L}}=4 \Omega$ <br>  $\mathrm{R}_{\mathrm{L}}=8 \Omega$ <br> $\mathrm{THD}+\mathrm{N}=10 \%$ $\mathrm{R}_{\mathrm{L}}=4 \Omega$ <br>  $\mathrm{R}_{\mathrm{L}}=8 \Omega$ | $\begin{gathered} \hline 9 \\ 5.5 \\ 12 \\ 8 \end{gathered}$ | $\begin{gathered} \hline 11 \\ 6 \\ 15 \\ 10 \\ \hline \end{gathered}$ |  | $\begin{aligned} & \hline W \\ & w \\ & w \\ & w \\ & w \end{aligned}$ |

| IDD, SLEEP | Sleep Supply Current | SLEEP = $\mathrm{V}_{\text {IH }}$ |  | 0.25 | 2 | mA |
| $\mathrm{I}_{\mathrm{q}}$ | Quiescent Current | $\mathrm{V}_{\mathrm{IN}}=0 \mathrm{~V}$ |  | 61 | 75 | mA |
| THD + N | Total Harmonic Distortion Plus Noise | Po = 9W/Channel |  | 0.04 |  | \% |
| IHF-IM | IHF Intermodulation Distortion | 19kHz, 20kHz, 1:1 (IHF) |  | 0.18 | 0.5 | \% |
| SNR | Signal-to-Noise Ratio | A-Weighted, Pout $=1 \mathrm{~W}, \mathrm{R}_{\mathrm{L}}=8 \Omega$ |  | 89 |  | dB |
| CS | Channel Separation | 30 kHz Bandwidth | 50 | 55 |  | dB |
| PSRR | Power Supply Rejection Ratio | Vripple $=100 \mathrm{mV}$. | 60 | 80 |  | dB |
| $\eta$ | Power Efficiency | Pout $=10 \mathrm{~W} /$ Channel, $\mathrm{R}_{\mathrm{L}}=8 \Omega$ |  | 88 |  | \% |
| V ${ }_{\text {OFFSET }}$ | Output Offset Voltage | No Load, MUTE = Logic Low |  | 50 | 150 | mV |
| $\mathrm{V}_{\text {OH }}$ | High-level output voltage (FAULT \& OVERLOAD) |  | 3.5 |  |  | V |
| VoL | Low-level output voltage (FAULT \& OVERLOAD) |  |  |  | 1 | V |
| eout | Output Noise Voltage | A-Weighted, input AC grounded |  | 100 |  | $\mu \mathrm{V}$ |

Note: Minimum and maximum limits are guaranteed but may not be 100\% tested.

PIN DESCRIPTION

| Pin | Function | Description |
| :---: | :---: | :---: |
| 2, 3 | DCAP2, DCAP1 | Charge pump switching pins. DCAP1 (pin 3) is a free running 300 kHz square wave between VDDA and DGND (12Vpp nominal). DCAP2 (pin 2) is level shifted 10 volts above DCAP1 (pin 3 ) with the same amplitude ( 12 Vpp nominal), frequency, and phase as DCAP1. |
| 4, 9 | V5D, V5A | Digital 5VDC, Analog 5VDC |
| $\begin{gathered} 5,8, \\ 17 \end{gathered}$ | AGND1, AGND2, AGND3 | Analog Ground |
| 6 | REF | Internal reference voltage; approximately 1.0 VDC. |
| 7 | OVERLOADB | A logic low output indicates the input signal has overloaded the amplifier. |
| 10, 14 | VP1, VP2 | Input stage output pins. |
| 11, 15 | IN1, IN2 | Single-ended inputs. Inputs are a "virtual" ground of an inverting opamp with approximately 2.4 VDC bias. |
| 12 | MUTE | When set to logic high, both amplifiers are muted and in idle mode. When low (grounded), both amplifiers are fully operational. If left floating, the device stays in the mute mode. This pin should be tied to GND if not used. |
| 16 | BIASCAP | Input stage bias voltage (approximately 2.4VDC). |
| 18 | SLEEP | When set to logic high, device goes into low power mode. If not used, this pin should be grounded |
| 19 | FAULT | A logic high output indicates thermal overload, or an output is shorted to ground, or another output. |
| 20,35 | PGND2, PGND1 | Power Grounds (high current) |
| 22 | DGND | Digital Ground |
| $\begin{aligned} & 24,27 ; \\ & 31,28 \end{aligned}$ | OUTP2 \& OUTM2; OUTP1 \& OUTM1 | Bridged outputs |
| $\begin{aligned} & 25,26, \\ & 29,30 \end{aligned}$ | $\begin{aligned} & \hline \text { VDD2, VDD2 } \\ & \text { VDD1, VDD1 } \end{aligned}$ | Supply pins for high current H-bridges, nominally 12VDC. |
| 13, 21, 23, 32, 34 | NC | Not connected. Not bonded internally. |
| 33 | VDDA | Analog 12VDC |
| 36 | CPUMP | Charge pump output (nominally 10V above VDDA) |
| 1 | 5VGEN | Regulated 5VDC source used to supply power to the input section (pins 4 and 9). |

TA2024 PINOUT

EXTERNALCOMPONENTS DESCRIPTION (Refer to the Application/Test Circuit)
Components Description

| $\mathrm{R}_{1}$ | Inverting Input Resistance to provide AC gain in conjunction with $\mathrm{R}_{\mathrm{F}}$. This input is biased at the BIASCAP voltage (approximately 2.4 VDC ). |
| :---: | :---: |
| $\mathrm{R}_{\mathrm{F}}$ | Feedback resistor to set AC gain in conjunction with $R_{i} ; A_{V}=12\left(R_{F} / R_{I}\right)$. Please refer to the Amplifier Gain paragraph in the Application Information section. |
| $\mathrm{C}_{1}$ | AC input coupling capacitor which, in conjunction with $R_{l}$, forms a highpass filter at $\mathrm{f}_{\mathrm{C}}=1 /\left(2 \pi \mathrm{R}_{\mathrm{l}} \mathrm{C}_{\mathrm{l}}\right)$ |
| $\mathrm{R}_{\text {REF }}$ | Bias resistor. Locate close to pin 6 (REF) and ground at pin 8 (AGND2). |
| $\mathrm{C}_{\text {A }}$ | BIASCAP decoupling capacitor. Should be located close to pin 16. |
| $\mathrm{C}_{\text {D }}$ | Charge pump input capacitor. This capacitor should be connected directly between pins 2 (DCAP2) and 3 (DCAP1) and located physically close to the TA2024. |
| $\mathrm{C}_{P}$ | Charge pump output capacitor that enables efficient high side gate drive for the internal H-bridges. To maximize performance, this capacitor should be connected directly between pin 36 (CPUMP) and pin 33 (VDDA). Please observe the polarity shown in the Application/ Test Circuit. |
| $\mathrm{C}_{\mathrm{s}}$ | Supply decoupling for the low current power supply pins. For optimum performance, these components should be located close to the pin and returned to their respective ground as shown in the Application/Test Circuit. |
| $\mathrm{C}_{\text {sw }}$ | Supply decoupling for the high current, high frequency H-Bridge supply pins. These components must be located as close to the device as possible to minimize supply overshoot and maximize device reliability. Both the high frequency bypassing ( 0.1 uF ) and bulk capacitor (180uF) should have good high frequency performance including low ESR and low ESL. Panasonic HFQ or FC capacitors are ideal for the bulk capacitor. |
| $\mathrm{C}_{\mathrm{z}}$ | Zobel Capacitor. |
| $\mathrm{R}_{\mathrm{z}}$ | Zobel resistor, which in conjunction with $\mathrm{C}_{\mathrm{z}}$, terminates the output filter at high frequencies. The combination of $\mathrm{R}_{\mathrm{z}}$ and $\mathrm{C}_{z}$ minimizes peaking of the output filter under both no load conditions or with real world loads, including loudspeakers which usually exhibit a rising impedance with frequency. |
| Do | Schottky diodes that minimize undershoots of the outputs with respect to power ground during switching transitions. For maximum effectiveness, these diodes must be located close to the output pins and returned to their respective PGND. Please see Application/Test Circuit for ground return pin. |
| Lo | Output inductor, which in conjunction with $\mathrm{C}_{0}$, demodulates (filters) the switching waveform into an audio signal. Forms a second order filter with a cutoff frequency of $f_{C}=1 /\left(2 \pi \sqrt{L_{O} C_{O}}\right)$ and a quality factor of $Q=R_{L} C_{O} / \sqrt{L_{O} C_{O}}$. |
| $\mathrm{C}_{0}$ | Output capacitor. |
| $\mathrm{C}_{\text {см }}$ | Common Mode Capacitor. |

## TYPICAL PERFORMANCE

## APPLICATION INFORMATION

## Layout Recommendations

The TA2024 is a power (high current) amplifier that operates at relatively high switching frequencies. The outputs of the amplifier switch between the supply voltage and ground at high speeds while driving high currents. This high-frequency digital signal is passed through an LC low-pass filter to recover the amplified audio signal. Since the amplifier must drive the inductive LC output filter and speaker loads, the amplifier outputs can be pulled above the supply voltage and below ground by the energy in the output inductance. To avoid subjecting the TA2024 to potentially damaging voltage stress, it is critical to have a good printed circuit board layout. It is recommended that Tripath's layout and application circuit be used for all applications and only be deviated from after careful analysis of the effects of any changes. Please contact Tripath Technology for further information regarding reference design material regarding the TA2024.

## TA2024 Amplifier Gain

The gain of the TA2024 is set by the ratio of two external resistors, $R_{l}$ and $R_{F}$, and is given by the following formula:

$$
\frac{V_{O}}{V_{1}}=12 \frac{R_{F}}{R_{I}}
$$

where $V_{I}$ is the input signal level and $V_{0}$ is the differential output signal level across the speaker.
9 Watts of RMS output power results from an 8.485 V RMS signal across an $8 \Omega$ speaker load. If $R_{F}=R_{l}$, then 9 Watts will be achieved with 0.707 V RMS of input signal.
$8.485 \mathrm{~V}_{\mathrm{RMS}}=\sqrt{\left(\mathrm{R}_{\mathrm{L}} * \mathrm{P}_{\mathrm{O}}\right)}=\sqrt{(8 \Omega * 9 \mathrm{~W})}$

## Protection Circuits

The TA2024 is guarded against over-temperature and over-current conditions. When the device goes into an over-temperature or over-current state, the FAULT pin goes to a logic HIGH state indicating a fault condition. When this occurs, the amplifier is muted, all outputs are TRISTATED, and will float to $1 / 2$ of $V_{D D}$.

Over-temperature Protection
An over-temperature fault occurs if the junction temperature of the part exceeds approximately $155^{\circ} \mathrm{C}$. The thermal hysteresis of the part is approximately $45^{\circ} \mathrm{C}$, therefore the fault will automatically clear when the junction temperature drops below $110^{\circ} \mathrm{C}$.

## Over-current Protection

An over-current fault occurs if more than approximately 7 amps of current flows from any of the amplifier output pins. This can occur if the speaker wires are shorted together or if one side of the speaker is shorted to ground. An over-current fault sets an internal latch that can only be cleared if the MUTE pin is toggled or if the part is powered down. Alternately, if the MUTE pin is connected to the FAULT pin, the HIGH output of the FAULT pin will toggle the MUTE pin and automatically reset the fault condition.

## Overload

The OVERLOADB pin is a 5 V logic output. When low, it indicates that the level of the input signal has overloaded the amplifier resulting in increased distortion at the output. The OVERLOADB signal can be used to control a distortion indicator light or LED through a simple buffer circuit, as the OVERLOADB cannot drive an LED directly.

## Sleep Pin

The SLEEP pin is a 5 V logic input that when pulled high $(>3.5 \mathrm{~V})$ puts the part into a low quiescent current mode. This pin is internally clamped by a zener diode to approximately 6 V thus allowing the pin to be pulled up through a large valued resistor ( 1 meg $\Omega$ recommended) to $V_{D D}$. To disable SLEEP mode, the sleep pin should be grounded.

## Fault Pin

The FAULT pin is a 5 V logic output that indicates various fault conditions within the device. These conditions include: low supply voltage, low charge pump voltage, low 5 V regulator voltage, over current at any output, and junction temperature greater than approximately $155^{\circ} \mathrm{C}$. All faults except overcurrent all reset upon removal of the condition. The FAULT output is capable of directly driving an LED through a series $200 \Omega$ resistor. If the FAULT pin is connected directly to the MUTE input an automatic reset will occur in the event of an over-current condition.

## Power Dissipation Derating

For operating at ambient temperatures above $25^{\circ} \mathrm{C}$ the device must be derated based on a $150^{\circ} \mathrm{C}$ maximum junction temperature, TJMAX as given by the following equation:
$P_{\text {DISS }}=\frac{\left(T_{J M A X}-T_{A}\right)}{\theta_{\text {JA }}}$
where...
PDISS = maximum power dissipation
TJMAX = maximum junction temperature of TA2024
TA = operating ambient temperature
$\theta J A=$ junction-to-ambient thermal resistance
Where $\theta_{\mathrm{JA}}$ of the package is determined from the following graph:

In the above graph Copper Area is the size of the copper pad on the PC board to which the heat slug of the TA2024 is soldered. The heat slug must be soldered to the PC Board to increase the maximum power dissipation capability of the TA2024 package. Soldering will minimize the likelihood of an over-temperature fault occurring during continuous heavy load conditions. The vias used for connecting the heatslug to the copper area on the PCB should be $0.013^{\prime \prime}$ diameter.

## Performance Measurements of the TA2024

The TA2024 operates by generating a high frequency switching signal based on the audio input. This signal is sent through a low-pass filter (external to the Tripath amplifier) that recovers an amplified version of the audio input. The frequency of the switching pattern is spread spectrum and typically varies between 100 kHz and 1.0 MHz , which is well above the $20 \mathrm{~Hz}-20 \mathrm{kHz}$ audio band. The pattern itself does not alter or distort the audio input signal but it does introduce some inaudible components.

The measurements of certain performance parameters, particularly noise related specifications such as THD+N, are significantly affected by the design of the low-pass filter used on the output as well as the bandwidth setting of the measurement instrument used. Unless the filter has a very sharp roll-off just beyond the audio band or the bandwidth of the measurement instrument is limited, some of the inaudible noise components introduced by the Tripath amplifier switching pattern will degrade the measurement.

One feature of the TA2024 is that it does not require large multi-pole filters to achieve excellent performance in listening tests, usually a more critical factor than performance measurements. Though using a multi-pole filter may remove high-frequency noise and improve THD+N type measurements (when they are made with wide-bandwidth measuring equipment), these same filters degrade frequency response. The TA2024 Evaluation Board uses the Test/Application Circuit in this data sheet, which has a simple two-pole output filter and excellent performance in listening tests. Measurements in this data sheet were taken using this same circuit with a limited bandwidth setting in the measurement instrument.

## PACKAGEINFORMATION

36-Lead Power Small Outline Package (PSOP), similar to JEDEC outline MO166, variation AE:

For Package Dimensions, please contact Tripath Technology

## ADVANCED INFORMATION

This is a product in development. Tripath Technology, Inc. reserves the right to make any changes without further notice to improve reliability, function and design.

Tripath and Digital Power Processing are trademarks of Tripath Technology. Other trademarks referenced in this document are owned by their respective companies.

Tripath Technology, Inc. reserves the right to make changes without further notice to any products herein to improve reliability, function or design. Tripath does not assume any liability arising out of the application of use of any product or circuit described herein; neither does it convey any license under its patent rights nor the rights of others.

TRIPATH'S PRODUCT ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN CONSENT OF THE PRESIDENT OF TRIPATH TECHONOLOGY, INC. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in this labeling, can be reasonably expected to result in significant injury of the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
